MYCenter 2.1 software improves SMT production control and efficiency. Three modules cover machine programming, data import and material handling, all unified into a redesigned single user interface that tracks thousands of parts while handling engineering changes, component deliveries and machine program revisions.

Provides a live database connection, allowing multiple users to work in parallel with real-time overviews of machine libraries. Displays nozzle size, tape pitch and width and landing pad information, ensuring correct part handling, orientation and placement. Convert bill-of-material (BoM) and Gerber data into ready-to-run machine programs. Material handling module gives real-time information on every individual reel, stick and tray. This makes it possible to track each carrier's exact location, quantity or feeding parameters as it is used in different parts of the factory. Can be used alone or integrated into an ERP system.
